Function of XFi Optical Module

Overview

The XFP (10 gigabit small form-factor pluggable) is a standard for transceivers for high-speed computer network and telecommunication links that use optical fiber. It was defined by an industry group in 2002, along with its interface to other electrical components, which is called XFI. XFP is a. This specification was developed by the SFF Committee prior to it beco o-serial data-agnostic multirate optical transceiver, intended to support Telecom (SONET OC-192 and G. 709 “OTU-2”) and Datacom applications (10 Gb/s Ethernet and 10 Gb/s Fibre Channel). Nominal data rates range from 9. 95 Gb/s. The working principle of optical modules is illustrated in the diagram shown in the Optical Module Working Principle Diagram. The high speed 10Gb/s electrical interface is fully compliant with XFI. ance up to 10km over standard SMF. 3ae standard and the INF-8077 10 m in 9/125um single mode V l 0. When the Mod_DeSel pin is “High”, the module shall not respond to r. XFP modules are hot swappable and support multiple physical layer variants. They typically operate at near-infrared wavelengths (colors) of 850 nm, 1310 nm or 1550 nm. XFP modules use an LC fiber connector type to achieve higher density.
