Network Switch Core Layer

Overview

Core Layer: The core layer is the backbone of the hierarchy network. The primary transmission and routing of data signals take place at the core layer only. Engineered to aggregate massive volumes of data from distribution switches, it provides ultra-low latency and maximum throughput to ensure uninterrupted routing and packet. The hierarchy Ethernet network is a three-layer integrated setup of networking devices. The strategic design of a hierarchy network may comprise more than three layers. It is a powerful backbone switch in the center of the network core layer, which centralizes multiple aggregation switches to the core and implements LAN routing. An enterprise network is a large network that may contain several campus networks spanning different.
