Optical Module Fiber Channel Interface

Overview

An SFP (or SFP+) is a hot-swappable optical module used to convert electrical signals into optical signals. Common SFP speeds for FC are 4Gbps, 8Gbps, 16Gbps, 32Gbps, and now even 64Gbps. Optical modules typically have an electrical interface on the side that connects to the inside of the system and an optical interface on the side that connects to the outside. Fibre Channel (FC) is a high-speed data transfer protocol providing in-order, lossless delivery of raw block data. Fibre Channel networks form a. The Fibre Channel physical layer is based on serial connections that use fiber optics to copper between corresponding pluggable modules. The modules may have a single lane, dual lanes or quad lanes that correspond to the SFP, SFP-DD and QSFP form factors. Fibre Channel does not use 8- or 16-lane modules (like CFP8, QSFP-DD, or COBO used in 400GbE) and there are no plans to use these expensive and comple
