POE switch controls lighting

Overview

What is PoE Lighting? PoE lighting uses Power over Ethernet technology to connect, monitor, and control LED light fixtures used in smart building solutions.

Key Takeaways

A PoE switch can both power and control lighting fixtures over a single Ethernet cable, enabling centralized, automated, and addressable lighting management.

How Po

E Switches Control LightingPoE (Power over Ethernet) switches deliver DC power and network connectivity to compatible lighting fixtures through standard Ethernet cables (Cat5e, Cat6, or Cat6a), eliminating the need for traditional AC wiring. Each fixture receives a unique IP address, allowing it to be individually controlled for dimming, scheduling, and automation.

Managed Po

E switches, such as those compliant with IEEE 802. 3bt (PoE++), can provide up to 90 watts per port, supporting high-power LED fixtures. Centralized Control and AutomationPoE lighting systems integrate with building management systems (BMS) or smart home platforms, enabling features like: Automated scheduling based on occupancy or daylight harvesting Real-time monitoring of energy usage and fixture status Dynamic lighting zones that can be reconfigured via software without rewiring Integration with security systems, where lights respond to motion or camera detection This centralized control reduces maintenance costs, improves energy efficiency, and allows predictive analytics for proactive fixture replacement.

Installation Considerations

Cabling: Cat5e is sufficient for low-power fixtures (56W),. Power Budgeting: Calculate total fixture wattage and add overhead for future expansion and voltage drop compensation. Switch Selection: Managed PoE switches are preferred for larger installations, while PoE injectors can power smaller setups but offer limited scalability.

Safety: PoE operates at low voltage (
