External Modulation Optical Module

Overview

External modulation involves manipulating the laser beam outside the laser cavity. Direct and external modulation are primarily used in the optical domain with LED and Laser devices as methods for converting electrical data into optical. Below is a simplified working principle diagram: Figure 3 Working Principle Diagram of Optical Transceiver The optical signal transmitted through optical fibers is not constant; instead, it is a modulated signal with varying intensity. The characteristics and application differences between DML and. Definition: Optical Modulation is the process by which a light wave is modulated (modified) according to a high-frequency electrical signal that contains information. These modified light waves are then transmitted either by a transparent medium or through an optical fiber cable. More specifically. rect modulation and external modulation. Aerospace, automotive and biomedical industries all heavily.
