PoE switch network cable voltage

Overview

A voltage of between 44 and 57 volts DC, usually 48 volts, is used to pump power over Ethernet onto the wire. Power over Ethernet (PoE) describes any of several standards or ad hoc systems that pass electric power along with data on twisted-pair Ethernet cabling. This allows a single cable to provide both a data connection and enough electricity to power networked devices such as wireless access points. By allowing Ethernet cables to deliver both power and data simultaneously, PoE+ voltage enables greater simplicity in connecting and operating devices like IP cameras, wireless access points, IP phones, access control systems, and IoT hardware. Read on for an extensive guide exploring everything. PoE is typically 48v, and it is a "negotiated" service. In normal PoE equipment there is no danger in connecting a non-PoE device to any PoE port.
